# Bipolar Neutrosophic Planar Graphs 

Muhammad AKRAM ${ }^{1, *}$, K. P. SHUM ${ }^{2}$<br>1. Department of Mathematics, University of the Punjab, New Campus, Lahore, Pakistan;<br>2. Institute of Mathematics, Yunnan University, Yunnan 650091, P. R. China

#### Abstract

Fuzzy graph theory is used for solving real-world problems in different fields, including theoretical computer science, engineering, physics, combinatorics and medical sciences. In this paper, we present conepts of bipolar neutrosophic multigraphs, bipolar neutrosophic planar graphs, bipolar neutrosophic dual graphs, and study some of their related properties. We also describe applications of bipolar neutrosophic graphs in road network and electrical connections.

Keywords Bipolar neutrosophic planar graphs; bipolar neutrosophic dual graphs
MR(2010) Subject Classification 03E72; 68R10; 68R05

## 1. Introduction

Fuzzy graph theory has a number of applications in modeling real time systems where the level of information inherent in the system varies with different levels of precision. Fuzzy models are becoming useful because of their aim in reducing the differences between the traditional numerical models used in engineering and sciences and the symbolic models used in expert systems. Kaufmann defined first fuzzy graph [1], then Rosenfeld [2] discussed several basic graphtheoretic concepts, including bridges, cut-nodes, connectedness, trees and cycles. Bhattacharya [3] gave some remarks on fuzzy graphs, and Sunitha and Vijayakumar [4] characterized fuzzy trees. Abdul-jabbar et al. [5] introduced the concept of a fuzzy dual graph and discussed some of its interesting properties. Samanta and Pal [6,7] introduced and investigated the concept of fuzzy planar graphs and studied several properties. On the other hand, Alshehri and Akram [8] introduced the concept of intuitionistic fuzzy planar graphs. Akram et al. [9] discussed the concept of bipolar fuzzy planar graphs. Dhavaseelan et al. [4] defined strong neutrosophic graphs. Akram and Shahzadi [10] introduced the notions of neutrosophic graphs and neutrosophic soft graphs. Akram and Sarwar [11] considered bipolar neutrosophic graphs with applications. They also have shown that Broumi et al. [12]'s definition is incorrect. In this paper, we introduce the notions of bipolar single-valued neutrosophic multigraphs, bipolar single-valued neutrosophic planar graphs, bipolar single-valued neutrosophic dual graphs, and investigate some of their interesting properties. We also describe applications of bipolar neutrosophic graphs in road network and electrical connections.

[^0]
## 2. Bipolar neutrosophic planar graphs

Smarandache [13] introduced neutrosophic sets as a generalization of fuzzy sets and intuitionistic fuzzy sets.

Definition 2.1 ([13]) A neutrosophic set $C$ on a non-empty set $X$ is characterized by a truth membership function $T_{C}: X \rightarrow[0,1]$, indeterminacy membership function $I_{C}: X \rightarrow[0,1]$ and a falsity membership function $F_{C}: X \rightarrow[0,1]$. There is no restriction on the sum of $T_{C}(x), I_{C}(x)$ and $F_{C}(x)$ for all $x \in X$.

Deli et al. [14] defined bipolar neutrosophic (BN) sets a generalization of bipolar fuzzy sets.
Definition 2.2 ([14]) A BN set on a nonempty set $X$ is an object of the form

$$
C=\left\{\left(y, T_{C}^{P}(x), I_{C}^{P}(x), F_{C}^{P}(x), T_{C}^{N}(x), I_{C}^{N}(x), F_{C}^{N}(x)\right): y \in X\right\}
$$

where, $T_{C}^{P}, I_{C}^{P}, F_{C}^{P}: Y \rightarrow[0,1]$ and $T_{C}^{N}, I_{C}^{N}, F_{C}^{N}: Y \rightarrow[-1,0]$. The positive values $T_{C}^{P}(x)$, $I_{C}^{P}(x), F_{C}^{P}(x)$ denote respectively the truth, indeterminacy and false membership degrees of an element $y \in Y$ whereas $T_{C}^{N}(x), I_{C}^{N}(x), F_{C}^{N}(x)$ denote the implicit counter property of the truth, indeterminacy and false membership degrees of the element $y \in X$ corresponding to the bipolar neutrosophic set $C$.

We define BN multisets based on the concept of Ye and Ye [15].
Definition 2.3 Let $X$ be a nonempty set with generic elements in $X$ denoted by $x$. A BN multiset $C$ drawn from $X$ is characterized by the three positive functions: count truth-membership of $C T_{C}^{P}$, count indeterminacy-membership of $C I_{C}^{P}$, and count falsity-membership of $C F_{C}^{P}$ such that $C T_{C}^{P}(x): X \rightarrow R^{+}, C I_{C}^{P}(x): X \rightarrow R^{+}, C F_{C}^{P}(x): X \rightarrow R^{+}$for $x \in X$, where $R^{+}$is the set of all real number multisets in the real unit interval $[0,1]$, and three negative functions: count truthmembership of $C T_{C}^{N}$, count indeterminacy-membership of $C I_{C}^{N}$, and count falsity-membership of $C F_{C}^{N}$ such that $C T_{C}^{N}(x): X \rightarrow R^{-}, C I_{C}^{N}(x): X \rightarrow R^{-}, C F_{C}^{N}(x): X \rightarrow R^{-}$for $x \in X$, where $R^{-}$is the set of all real number multisets in the real unit interval $[-1,0]$. Then, a bipolar single valued neutrosophic multiset $A$ is denoted by $A=\left\{\left\langle x,\left(\left(T^{1}\right)_{C}^{P}(x),\left(T^{2}\right)_{C}^{P}(x), \ldots,\left(T^{q}\right)_{C}^{P}(x)\right)\right.\right.$, $\left(\left(I^{1}\right)_{C}^{P}(x),\left(I^{2}\right)_{C}^{P}(x), \ldots,\left(I^{q}\right)_{C}^{P}(x)\right),\left(\left(F^{1}\right)_{C}^{P}(x),\left(F^{2}\right)_{C}^{P}(x), \ldots,\left(F^{q}\right)_{C}^{P}(x)\right),\left(T^{1}\right)_{C}^{N}(x),\left(T^{2}\right)_{C}^{N}(x), \ldots$, $\left.\left.\left.\left(T^{q}\right)_{C}^{N}(x)\right),\left(\left(I^{1}\right)_{C}^{N}(x),\left(I^{2}\right)_{C}^{N}(x), \ldots,\left(I^{q}\right)_{C}^{N}(x)\right),\left(\left(F^{1}\right)_{C}^{N}(x),\left(F^{2}\right)_{C}^{N}(x), \ldots,\left(F^{q}\right)_{C}^{N}(x)\right)\right\rangle \mid x \in X\right\}$, where the positive truth, indeterminacy and falsity-membership sequences $\left(\left(T^{1}\right)_{C}^{P}(x),\left(T^{2}\right)_{C}^{P}(x)\right.$, $\left.\ldots,\left(T^{q}\right)_{C}^{P}(x)\right),\left(\left(I^{1}\right)_{C}^{P}(x),\left(I^{2}\right)_{C}^{P}(x), \ldots,\left(I^{q}\right)_{C}^{P}(x)\right),\left(\left(F^{1}\right)_{C}^{P}(x),\left(F^{2}\right)_{C}^{P}(x), \ldots,\left(F^{q}\right)_{C}^{P}(x)\right)$ may be in decreasing or increasing order, and sum of $\left(T_{C}^{i}\right)^{P}(x),\left(I^{i}\right)_{C}^{P}(x),\left(F^{i}\right)_{C}^{P}(x) \in[0,1]$ satisfies the condition $0 \leq \sup \left(T^{i}\right)_{C}^{P}(x)+\sup \left(I^{i}\right)_{C}^{P}(x)+\sup \left(F^{i}\right)_{C}^{P}(x) \leq 3$ for $x \in X$ and $i=1,2, \ldots, q$, the negative truth, indeterminacy and falsity-membership sequences $\left(\left(T^{1}\right)_{C}^{P}(x),\left(T^{2}\right)_{C}^{P}(x), \ldots,\left(T^{q}\right)_{C}^{P}(x)\right)$, $\left(\left(I^{1}\right)_{C}^{N}(x),\left(I^{2}\right)_{C}^{N}(x), \ldots,\left(I^{q}\right)_{C}^{N}(x)\right),\left(\left(F^{1}\right)_{C}^{N}(x),\left(F^{2}\right)_{C}^{N}(x), \ldots,\left(F^{q}\right)_{C}^{N}(x)\right)$ may be in decreasing or increasing order, and sum of $\left(T_{C}^{i}\right)^{N}(x),\left(I^{i}\right)_{C}^{N}(x),\left(F^{i}\right)_{C}^{N}(x) \in[-1,0]$ satisfies the condition $-3 \leq \inf \left(T^{i}\right)_{C}^{N}(x)+\inf \left(I^{i}\right)_{C}^{N}(x)+\inf \left(F^{i}\right)_{C}^{N}(x) \leq 0$ for $x \in X$ and $i=1,2, \ldots, q$. For convenience, a $B N$ multiset $C$ can be denoted by the simplified form:

$$
C=\left\{\left\langle x,(T)_{C}^{P}(x)_{i},(I)_{C}^{P}(x)_{i},(F)_{C}^{P}(x)_{i},(T)_{C}^{N}(x)_{i},(I)_{C}^{N}(x)_{i},(F)_{C}^{N}(x)_{i}\right\rangle \mid x \in X, i=1,2, \ldots, q\right\}
$$

We now define the concept of bipolar neutrosophic graphs.
Definition 2.4 A bipolar neutrosophic graph on a nonempty set $X$ is a pair $G=(C, D)$, where $C$ is a bipolar neutrosophic set on $X$ and $D$ is a bipolar neutrosophic relation in $X$ such that
(a) $T_{D}^{P}(y z) \leq \min \left(T_{C}^{P}(y), T_{C}^{P}(z)\right)$;
(b) $I_{D}^{P}(y z) \leq \min \left(I_{C}^{P}(y), I_{C}^{P}(z)\right)$;
(c) $F_{D}^{P}(y z) \leq \max \left(F_{C}^{P}(y), F_{C}^{P}(z)\right)$;
(d) $T_{D}^{N}(y z) \geq \max \left(T_{C}^{N}(y), T_{C}^{N}(z)\right)$;
(e) $I_{D}^{N}(y z) \geq \max \left(I_{C}^{N}(y), I_{C}^{N}(z)\right)$;
(f) $F_{D}^{N}(y z) \geq \min \left(F_{C}^{N}(y), F_{C}^{N}(z)\right)$
for all $y, z \in X$. Note that $D$ is called a $B N$ relation on $C$.
Example 2.5 Consider a bipolar neutrosophic graph $G=(C, D)$ on $X=\{x, y, z\}$ as shown in Figure 2.1.

Figure 2.1 Bipolar neutrosophic graph

Definition 2.6 Let $C=\left(T_{C}^{P}, I_{C}^{P}, F_{C}^{P}, T_{C}^{N}, I_{C}^{N}, F_{C}^{N}\right)$ be a $B N$ set on $V$ and let $D=\left\{\left(x y, T_{D}^{P}(x y)_{i}\right.\right.$, $\left.\left.I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=1,2, \ldots, m \mid x y \in V \times V\right\}$ be a BN multiset of $V \times V$ such that
(g) $T_{D}^{P}(x y)_{i} \leq \min \left\{T_{C}^{P}(x), T_{C}^{P}(y)\right\}$;
(h) $T_{D}^{N}(x y)_{i} \geq \max \left\{T_{C}^{N}(x), T_{C}^{N}(y)\right\}$;
(i) $I_{D}^{P}(x y)_{i} \leq \min \left\{I_{C}^{P}(x), I_{C}^{P}(y)\right\}$;
(j) $I_{D}^{N}(x y)_{i} \geq \max \left\{I_{C}^{N}(x), I_{C}^{N}(y)\right\}$;
(k) $F_{D}^{P}(x y)_{i} \leq \max \left\{F_{C}^{P}(x), F_{C}^{P}(y)\right\}$;
(l) $F_{D}^{N}(x y)_{i} \geq \min \left\{F_{C}^{N}(x), F_{C}^{N}(y)\right\}$
for all $i=1,2, \ldots, m$. Then $G=(C, D)$ is called a $B N$ multigraph.
There may be more than one edge between the vertices $x$ and $y$. The positive values $T_{D}^{P}(x y)_{i}$, $I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}$ represent truth, indeterminacy and falsity of the edge $x y$ in $G$, whereas the negative values $T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}$ represent the implicit counter property of the truth,
indeterminacy and false membership degrees of the edge $x y$ in $G$. $m$ denotes the number of edges between the vertices. In BN multigraph $G, D$ is said to be BN multiedge set.

Example 2.7 Let $G^{*}=(V, E)$, where $V=\{a, b, c, d\}, E=\{a b, a b, a b, b c, b d\}$. Let $C=\left(T_{C}^{P}\right.$, $\left.I_{C}^{P}, F_{C}^{P}, T_{C}^{N}, I_{C}^{N}, F_{C}^{N}\right)$ be a BN set on $V$ and $D=\left(T_{D}^{P}, I_{D}^{P}, F_{D}^{P}, T_{D}^{N}, I_{D}^{N}, F_{D}^{N}\right)$ be a BN multiedge set on $E \subseteq V \times V$ defined in Tables 2.1 and 2.2.

Table 2.2 BN multiedge set $D$

By direct calculations, we see from Figure 2.2 that it is a BN multigraph.

Figure 2.2 Neutrosophic multigraph

Definition 2.8 Let $D=\left\{\left(x y, T_{D}^{P}(x y)_{i}, I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=\right.$ $1,2, \ldots, m \mid x y \in V \times V\}$ be a $B N$ multiedge set in $B N$ multigraph $G$. The degree of a vertex $x \in V$, denoted by $\operatorname{deg}(x)$, is defined by

$$
\operatorname{deg}(x)=\left(\sum_{i=1}^{m} T_{D}^{P}(x y)_{i}, \sum_{i=1}^{m} I_{D}^{P}(x y)_{i}, \sum_{i=1}^{m} F_{D}^{P}(x y)_{i}, \sum_{i=1}^{m} T_{D}^{N}(x y)_{i}, \sum_{i=1}^{m} I_{D}^{N}(x y)_{i}, \sum_{i=1}^{m} F_{D}^{N}(x y)_{i}\right)
$$

Example 2.9 In Example 2.7, the degree of vertices $a, b, c, d$ are $\operatorname{deg}(a)=(0.5,0.5,0.4,-0.5,-0.5,-0.4)$, $\operatorname{deg}(b)=(0.9,0.8,0.9,-0.9,-0.8,-0.9), \operatorname{deg}(c)=(0.3,0.1,0.3,-0.3,-0.1,-0.3)$ and $\operatorname{deg}(d)=$ (0.1, 0.2, 0.2, -0.1, -0.2, -0.2).

Definition 2.10 Let $D=\left\{\left(x y, T_{D}^{P}(x y)_{i}, I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=\right.$
$1,2, \ldots, m \mid x y \in V \times V\}$ be a $B N$ multiedge set in $B N$ multigraph $G$. A multiedge $x y$ of $G$ is strong if the following conditions are satisfied:
(m) $\frac{1}{2} \min \left\{T_{C}^{P}(x), T_{C}^{P}(y)\right\} \leq T_{D}^{P}(x y)_{i}$;
(n) $\frac{1}{2} \max \left\{T_{C}^{N}(x), T_{C}^{N}(y)\right\} \geq T_{D}^{N}(x y)_{i}$;
(o) $\frac{1}{2} \min \left\{I_{C}^{P}(x), I_{C}^{P}(y)\right\} \leq I_{D}^{P}(x y)_{i}$;
(p) $\frac{1}{2} \max \left\{I_{C}^{N}(x), I_{C}^{N}(y)\right\} \geq I_{D}^{N}(x y)_{i}$;
(q) $\frac{1}{2} \max \left\{F_{C}^{P}(x), F_{C}^{P}(y)\right\} \geq F_{D}^{P}(x y)_{i}$;
(r) $\frac{1}{2} \min \left\{F_{C}^{N}(x), F_{C}^{N}(y)\right\} \leq F_{D}^{N}(x y)_{i}$
for all $i=1,2, \ldots, m$.
Definition 2.11 Let $D=\left\{\left(x y, T_{D}^{P}(x y)_{i}, I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=\right.$ $1,2, \ldots, m \mid x y \in V \times V\}$ be a $B N$ multiedge set in $B N$ multigraph $G$. A BN multigraph $G$ is complete if the following conditions are satisfied:
(s) $\min \left\{T_{C}^{P}(x), T_{C}^{P}(y)\right\}=T_{D}^{P}(x y)_{i}$;
(t) $\max \left\{T_{C}^{N}(x), T_{C}^{N}(y)\right\}=T_{D}^{N}(x y)_{i}$;
(u) $\min \left\{I_{C}^{P}(x), I_{C}^{P}(y)\right\}=I_{D}^{P}(x y)_{i}$;
(v) $\max \left\{I_{C}^{N}(x), I_{C}^{N}(y)\right\}=I_{D}^{N}(x y)_{i}$;
(w) $\max \left\{F_{C}^{P}(x), F_{C}^{P}(y)\right\}=F_{D}^{P}(x y)_{i}$;
(x) $\min \left\{F_{C}^{N}(x), F_{C}^{N}(y)\right\}=F_{D}^{N}(x y)_{i}$
for all $i=1,2, \ldots, m$ and for all $x, y \in V$.
Example 2.12 Consider a BN multigraph $G$ as shown in Figure 2.3. By routine calculations, it is easy to see that Figure 2.3 is a BN complete multigraph.

Figure 2.3 Bipolar neutrosophic complete multigraph
Suppose that geometric insight for BN graphs has only one crossing between single valued neutrosophic edges $\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)$ and $\left(c d, T_{D}^{P}(c d)_{i}\right.$, $\left.I_{D}^{P}(c d)_{i}, F_{D}^{P}(c d)_{i}, T_{D}^{N}(c d)_{i}, I_{D}^{N}(c d)_{i}, F_{D}^{N}(c d)_{i}\right)$. We note that:

- If $\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)=(1,1,1,-1,-1,-1)$ and $\left(c d, T_{D}^{P}(c d)_{i}, I_{D}^{P}(c d)_{i}, F_{D}^{P}(c d)_{i}, T_{D}^{N}(c d)_{i}, I_{D}^{N}(c d)_{i}, F_{D}^{N}(c d)_{i}\right)=(0,0,0,0,0,0)$ or $\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}\right.$, $\left.F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)=(0,0,0,0,0,0),\left(c d, T_{D}^{P}(c d)_{i}, I_{D}^{P}(c d)_{i}, F_{D}^{P}(c d)_{i}, T_{D}^{N}(c d)_{i}\right.$, $\left.I_{D}^{N}(c d)_{i}, F_{D}^{N}(c d)_{i}\right)=(1,1,1,-1,-1,-1)$, then BN graph has no crossing,
- If $\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)=(1,1,1,-1,-1,-1)$ and $\left(c d, T_{D}^{P}(c d)_{i}, I_{D}^{P}(c d)_{i}, F_{D}^{P}(c d)_{i}, T_{D}^{N}(c d)_{i}, I_{D}^{N}(c d)_{i}, F_{D}^{N}(c d)_{i}\right)=(1,1,1,-1,-1,-1)$, then there ex-
ists a crossing for the representation of the graph.
Definition 2.13 The strength of the BN edge $a b$ can be measured by the value

$$
\begin{aligned}
S_{a b}= & \left(\left(S_{T^{P}}\right)_{a b},\left(S_{I^{P}}\right)_{a b},\left(S_{F^{P}}\right)_{a b},\left(S_{T^{N}}\right)_{a b},\left(S_{I^{N}}\right)_{a b},\left(S_{F^{N}}\right)_{a b}\right) \\
= & \left(\frac{T_{D}^{P}(a b)_{i}}{\min \left(T_{C}^{P}(a), T_{C}^{P}(b)\right)}, \frac{I_{D}^{P}(a b)_{i}}{\min \left(I_{C}^{P}(a), I_{C}^{P}(b)\right)}, \frac{F_{D}^{P}(a b)_{i}}{\max \left(F_{C}^{P}(a), F_{C}^{P}(b)\right)},\right. \\
& \left.\frac{T_{D}^{N}(a b)_{i}}{\max \left(T_{C}^{N}(a), T_{C}^{N}(b)\right)}, \frac{I_{D}^{N}(a b)_{i}}{\max \left(I_{C}^{N}(a), I_{C}^{N}(b)\right)}, \frac{F_{D}^{N}(a b)_{i}}{\min \left(F_{C}^{N}(a), F_{C}^{N}(b)\right)}\right) .
\end{aligned}
$$

Definition 2.14 Let $G$ be a $B N$ multigraph. An edge $a b$ is said to be a $B N$ strong if $\left(S_{T^{P}}\right)_{a b} \geq 0.5,\left(S_{I^{P}}\right)_{a b} \geq 0.5,\left(S_{F^{P}}\right)_{a b} \geq 0.5,\left(S_{T^{N}}\right)_{a b} \leq-0.5,\left(S_{I^{N}}\right)_{a b} \leq-0.5,\left(S_{F^{N}}\right)_{a b} \leq-0.5$ otherwise, we call weak edge.

Definition 2.15 Let $G=(C, D)$ be a $B N$ multigraph such that $D$ contains two edges $\left(a b, T_{D}^{P}(a b)_{i}\right.$, $\left.I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)$ and $\left(c d, T_{D}^{P}(c d)_{j}, I_{D}^{P}(c d)_{j}, F_{D}^{P}(c d)_{j}, T_{D}^{N}(c d)_{j}, I_{D}^{N}(c d)_{j}\right.$, $\left.F_{D}^{N}(c d)_{j}\right)$ intersected at a point $P$, where $i$ and $j$ are fixed integers. We define the intersecting value at the point $Q$ by

$$
\begin{aligned}
\mathcal{S}_{Q}= & \left(\left(\mathcal{S}_{\mathcal{T}^{\mathcal{P}}}\right)_{Q},\left(\mathcal{S}_{\mathcal{I}^{\mathcal{P}}}\right)_{Q},\left(\mathcal{S}_{\mathcal{F}^{\mathcal{P}}}\right)_{Q},\left(\mathcal{S}_{\mathcal{T}^{\mathcal{N}}}\right)_{Q},\left(\mathcal{S}_{\mathcal{I}^{\mathcal{N}}}\right)_{Q},\left(\mathcal{S}_{\mathcal{F}^{\mathcal{N}}}\right)_{Q}\right) \\
= & \left(\frac{\left(S_{T^{P}}\right)_{a b}+\left(S_{T^{P}}\right)_{c d}}{2}, \frac{\left(S_{I^{P}}\right)_{a b}+\left(S_{I^{P}}\right)_{c d}}{2}, \frac{\left(S_{F^{P}}\right)_{a b}+\left(S_{F^{P}}\right)_{c d}}{2},\right. \\
& \left.\frac{\left(S_{T^{N}}\right)_{a b}+\left(S_{T^{N}}\right)_{c d}}{2}, \frac{\left(S_{I^{N}}\right)_{a b}+\left(S_{I^{N}}\right)_{c d}}{2}, \frac{\left(S_{F^{N}}\right)_{a b}+\left(S_{F^{N}}\right)_{c d}}{2}\right) .
\end{aligned}
$$

If the number of point of intersections in a BN multigraph increases, planarity decreases. Thus for BN multigraph, $\mathcal{S}_{Q}$ is inversely proportional to the planarity. We now introduce the concept of a BN planar graph.

Definition 2.16 Let $G$ be a $B N$ multigraph and $Q_{1}, Q_{2}, \ldots, Q_{z}$ be the points of intersection between the edges for a certain geometrical representation. $G$ is said to be a BN planar graph with $B N$ planarity value $f=\left(f_{T^{P}}, f_{I^{P}}, f_{F^{P}}, f_{T^{N}}, f_{I^{N}}, f_{F^{N}}\right)$, where

$$
\begin{aligned}
f= & \left(f_{T^{P}}, f_{I^{P}}, f_{F^{P}}, f_{T^{N}}, f_{I^{N}}, f_{F^{N}}\right) \\
= & \left(\frac{1}{1+\left\{\left(S_{T^{P}}\right)_{Q_{1}}+\left(S_{T^{P}}\right)_{Q_{2}}+\cdots+\left(S_{T^{P}}\right)_{Q_{z}}\right\}}, \frac{1}{1+\left\{\left(S_{I^{P}}\right)_{Q_{1}}+\left(S_{I^{P}}\right)_{Q_{2}}+\cdots+\left(S_{I^{P}}\right)_{Q_{z}}\right\}},\right. \\
& \frac{1}{1+\left\{\left(S_{F^{P}}\right)_{Q_{1}}+\left(S_{F^{P}}\right)_{Q_{2}}+\cdots+\left(S_{F^{P}}\right)_{Q_{z}}\right\}}, \frac{1}{-1-\left\{\left(S_{T^{N}}\right)_{Q_{1}}+\left(S_{T^{N}}\right)_{Q_{2}}+\cdots+\left(S_{T^{N}}\right)_{Q_{z}}\right\}}, \\
& \left.\frac{1}{-1-\left\{\left(S_{I^{N}}\right)_{Q_{1}}+\left(S_{I^{N}}\right)_{Q_{2}}+\cdots+\left(S_{I^{N}}\right)_{Q_{z}}\right\}}, \frac{1}{-1-\left\{\left(S_{F^{N}}\right)_{Q_{1}}+\left(S_{F^{N}}\right)_{Q_{2}}+\cdots+\left(S_{F^{N}}\right)_{Q_{z}}\right\}}\right) .
\end{aligned}
$$

Clearly, $f=\left(f_{T^{P}}, f_{I^{P}}, f_{F^{P}}, f_{T^{N}}, f_{I^{N}}, f_{F^{N}}\right)$ is bounded and $0<f_{T^{P}} \leq 1,0<f_{I^{P}} \leq 1,0<$ $f_{F^{P}} \leq 1,-1<f_{T^{N}} \leq 0,-1<f_{I^{N}} \leq 0,-1<f_{F^{N}} \leq 0$.

If there is no point of intersection for a certain geometrical representation of a BN planar graph, then its BN planarity value is $(1,1,1,-1,-1,-1)$. We conclude that every BN graph is a BN planar graph with certain BN planarity value.

Example 2.17 Consider a multigraph $G^{*}=(V, E)$ such that $V=\{a, b, c, d, e\}$,

$$
E=\{a b, a c, a d, a d, b c, b d, c d, c e, a e, d e, b e\}
$$

Let $C=\left(T_{C}^{P}, I_{C}^{P}, F_{C}^{P}, T_{C}^{N}, I_{C}^{N}, F_{C}^{N}\right)$ be a BN set of $V$ and let $D=\left(T_{D}^{P}, I_{D}^{P}, F_{D}^{P}, T_{D}^{N}, I_{D}^{N}, F_{D}^{N}\right)$ be a BN multiedge set of $V \times V$ defined in Tables 2.3 and 2.4.

Table 2.4 BN multiedge set $D$

Figure 2.4 Neutrosophic planar graph
The BN multigraph as shown in Figure 2.4 has two points of intersection $P_{1}$ and $P_{2} . P_{1}$ is a point between the edges $(a d, 0.2,0.2,0.1,-0.2,-0.2,-0.1)$ and $(b c, 0.2,0.2,0.1,-0.2,-0.2,-0.1)$
and $P_{2}$ is between $(a d, 0.3,0.3,0.1,-0.3,-0.3,-0.1)$ and $(b c, 0.2,0.2,0.1,-0.2,-0.2,-0.1)$. For the edge $(a d, 0.2,0.2,0.1,-0.2,-0.2,-0.1), S_{a d}=(0.4,0.4,0.5,-0.4,-0.4,-0.5)$. For the edge $(a d, 0.3,0.3,0.1,-0.3,-0.3,-0.1), S_{a d}=(0.6,0.6,0.5,-0.6,-0.6,-0.5)$ and for the edge $(b c, 0.2$, $0.2,0.1,-0.2,-0.2,-0.1), S_{b c}=(0.6667,0.6667,1,-0.6667,-0.6667,-1)$.

For the first point of intersection $P_{1}$, intersecting value $\mathcal{S}_{P_{1}}$ is $(0.5334,0.5334,0.75,-0.5334$, $-0.5334,-0.75)$ and that for the second point of intersection $P_{2}, \mathcal{S}_{P_{2}}=(0.63335,0.63335,0.75$, $-0.63335,-0.63335,-0.75)$. Therefore, the BN planarity value for the BN multigraph shown in Figure 2.4 is $(0.461,0.461,0.4,-0.461,-0.461,-0.4)$.

Theorem 2.18 Let $G$ be a $B N$ complete multigraph. The planarity value, $f=\left(f_{T^{P}}, f_{I^{P}}, f_{F^{P}}\right.$, $\left.f_{T^{N}}, f_{I^{N}}, f_{F^{N}}\right)$ of $G$ is given by $f_{T^{P}}=\frac{1}{1+n_{Q}}, f_{I^{P}}=\frac{1}{1+n_{Q}}$ and $f_{F^{P}}=\frac{1}{1+n_{Q}}$ such that $f_{T^{P}}+f_{I^{P}}+$ $f_{F^{P}} \leq 3, f_{T^{N}}=\frac{1}{-1-n_{Q}}, f_{I^{N}}=\frac{1}{-1-n_{Q}}$ and $f_{F^{N}}=\frac{1}{-1-n_{Q}}$ such that $-3 \leq f_{T^{N}}+f_{I^{N}}+f_{F^{N}} \leq 0$ where $n_{Q}$ is the number of points of intersection between the edges in $G$.

Definition 2.19 A BN planar graph $G$ is called strong $B N$ planar graph if the BN planarity value $f=\left(f_{T^{P}}, f_{I^{P}}, f_{F^{P}}, f_{T^{N}}, f_{I^{N}}, f_{F^{N}}\right)$ of the graph is $f_{T^{P}} \geq 0.5, f_{I^{P}} \geq 0.5, f_{F^{P}} \leq 0.5$, $f_{T^{N}} \leq-0.5, f_{I^{N}} \leq-0.5, f_{F^{P}} \geq-0.5$.

Theorem 2.20 Let $G$ be a strong BN planar graph. The number of points of intersection between strong edges in $G$ is at most one.

Proof Let $G$ be a strong BN planar graph. Assume that $G$ has at least two points of intersection $P_{1}$ and $P_{2}$ between two strong edges in $G$. For any strong edge

$$
\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right),
$$

$T_{D}^{P}(a b)_{i} \geq \frac{1}{2} \min \left\{T_{C}^{P}(a), T_{C}^{P}(b)\right\}, I_{D}^{P}(a b)_{i} \geq \frac{1}{2} \min \left\{I_{C}^{P}(a), I_{C}^{P}(b)\right\}, F_{D}^{P}(a b)_{i} \leq \frac{1}{2} \max \left\{F_{C}^{P}(a), F_{C}^{P}(b)\right\}$,
$T_{D}^{N}(a b)_{i} \leq \frac{1}{2} \max \left\{T_{C}^{N}(a), T_{C}^{N}(b)\right\}, I_{D}^{N}(a b)_{i} \leq \frac{1}{2} \max \left\{I_{C}^{N}(a), I_{C}^{N}(b)\right\}, F_{D}^{N}(a b)_{i} \geq \frac{1}{2} \min \left\{F_{C}^{N}(a), F_{C}^{N}(b)\right\}$.
This shows that $\left(S_{T^{P}}\right)_{a b} \geq 0.5,\left(S_{I^{P}}\right)_{a b} \geq 0.5,\left(S_{F^{P}}\right)_{a b} \leq 0.5,\left(S_{T^{N}}\right)_{a b} \leq-0.5,\left(S_{I^{N}}\right)_{a b} \leq$ $-0.5,\left(S_{F^{N}}\right)_{a b} \geq-0.5$. Thus for two intersecting strong edges

$$
\left(a b, T_{D}^{P}(a b)_{i}, I_{D}^{P}(a b)_{i}, F_{D}^{P}(a b)_{i}, T_{D}^{N}(a b)_{i}, I_{D}^{N}(a b)_{i}, F_{D}^{N}(a b)_{i}\right)
$$

and $\left(c d, T_{D}^{P}(c d)_{j}, I_{D}^{P}(c d)_{j}, F_{D}^{P}(c d)_{j}, T_{D}^{N}(c d)_{j}, I_{D}^{N}(c d)_{j}, F_{D}^{N}(c d)_{j}\right)$,

$$
\begin{gathered}
\frac{\left(S_{T^{P}}\right)_{a b}+\left(S_{T^{P}}\right)_{c d}}{2} \geq 0.5, \frac{\left(S_{I^{P}}\right)_{a b}+\left(S_{I^{P}}\right)_{c d}}{2} \geq 0.5, \frac{\left(S_{F^{P}}\right)_{a b}+\left(S_{F^{P}}\right)_{c d}}{2} \leq 0.5 \\
\frac{\left(S_{T^{N}}\right)_{a b}+\left(S_{T^{N}}\right)_{c d}}{2} \leq-0.5, \frac{\left(S_{I^{N}}\right)_{a b}+\left(S_{I^{N}}\right)_{c d}}{2} \leq-0.5, \frac{\left(S_{F^{N}}\right)_{a b}+\left(S_{F^{N}}\right)_{c d}}{2} \geq-0.5
\end{gathered}
$$

That is,
$\left(S_{T^{P}}\right)_{Q_{1}} \geq 0.5,\left(S_{I^{P}}\right)_{Q_{1}} \geq 0.5,\left(S_{F^{P}}\right)_{Q_{1}} \leq 0.5,\left(S_{T^{N}}\right)_{Q_{1}} \leq-0.5,\left(S_{I^{N}}\right)_{Q_{1}} \leq-0.5,\left(S_{F^{N}}\right)_{Q_{1}} \geq-0.5$.
Similarly,
$\left(S_{T^{P}}\right)_{Q_{2}} \geq 0.5,\left(S_{I^{P}}\right)_{Q_{2}} \geq 0.5,\left(S_{F^{P}}\right)_{Q_{2}} \leq 0.5,\left(S_{T^{N}}\right)_{Q_{2}} \leq-0.5,\left(S_{I^{N}}\right)_{Q_{2}} \leq-0.5,\left(S_{F^{N}}\right)_{Q_{2}} \geq-0.5$.

This implies that $1+\left(S_{T^{P}}\right)_{Q_{1}}+\left(S_{T^{P}}\right)_{Q_{2}} \geq 2,1+\left(S_{I^{P}}\right)_{Q_{1}}+\left(S_{I^{P}}\right)_{Q_{2}} \geq 2,1+\left(S_{F^{P}}\right)_{Q_{1}}+$ $\left(S_{F^{P}}\right)_{Q_{2}} \leq 2,-1+\left(S_{T^{N}}\right)_{Q_{1}}+\left(S_{T^{N}}\right)_{Q_{2}} \leq-2,-1+\left(S_{I^{N}}\right)_{Q_{1}}+\left(S_{I^{N}}\right)_{Q_{2}} \leq-2,-1+\left(S_{F^{N}}\right)_{Q_{1}}+$ $\left(S_{F^{N}}\right)_{Q_{2}} \geq-2$. Therefore,

$$
\begin{aligned}
& f_{T^{P}}=\frac{1}{1+\left(S_{T^{P}}\right)_{Q_{1}}+\left(S_{T^{P}}\right)_{Q_{2}}} \leq 0.5, \quad f_{I^{P}}=\frac{1}{1+\left(S_{I^{P}}\right)_{Q_{1}}+\left(S_{I^{P}}\right)_{Q_{2}}} \leq 0.5 \\
& f_{F^{P}}=\frac{1}{1+\left(S_{F^{P}}\right)_{Q_{1}}+\left(S_{F^{P}}\right)_{Q_{2}}} \geq 0.5, \quad f_{T^{N}}=\frac{1}{-1+\left(S_{T^{N}}\right)_{Q_{1}}+\left(S_{T^{N}}\right)_{Q_{2}}} \geq-0.5 \\
& f_{I^{N}}=\frac{1}{-1+\left(S_{I^{N}}\right)_{Q_{1}}+\left(S_{I^{N}}\right)_{Q_{2}}} \geq-0.5, \quad f_{F^{N}}=\frac{1}{-1+\left(S_{F^{N}}\right)_{Q_{1}}+\left(S_{F^{N}}\right)_{Q_{2}}} \leq-0.5
\end{aligned}
$$

It contradicts the fact that the BN graph is a strong BN planar graph. Thus the number of the points of intersection between strong edges cannot be two. Obviously, if the number of the points of intersection of strong BN edges increases, the BN planarity value decreases. Similarly, if the number of the points of intersection of strong edges is one, then the BN planarity value $f_{T^{P}}>0.5, f_{I^{P}}>0.5, f_{I^{P}}>0.5, f_{T^{N}}<-0.5, f_{I^{N}}<-0.5, f_{I^{N}}<-0.5$. Any BN planar graph without any crossing between edges is a strong BN planar graph. Thus, we conclude that the maximum number of the points of intersection between the strong edges in $G$ is one.

Face of a BN planar graph is an important parameter. Face of a BN graph is a region bounded by BN edges. Every BN face is characterized by BN edges in its boundary. If all the edges in the boundary of a BN face have $T^{P}, I^{P}, F^{P}, T^{N}, I^{N}$ and $F^{N}$ values $(1,1,1,-1,-1,-1)$ and $(0,0,0,0,0,0)$, respectively, it becomes crisp face. If one of such edges is removed or has $T^{P}$, $I^{P}, F^{P}, T^{N}, I^{N}$ and $F^{N}$ values $(0,0,0,0,0,0)$ and $(1,1,1,-1,-1,-1)$, respectively, the BN face does not exist. So the existence of a BN face depends on the minimum value of strength of BN edges in its boundary. A BN face and its $T^{P}, I^{P}, F^{P}, T^{N}, I^{N}$, and $F^{N}$ values of a BN graph are defined below.

Definition 2.21 Let $G$ be a $B N$ planar graph and $D=\left\{\left(x y, T_{D}^{P}(x y)_{i}, I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}\right.\right.$, $\left.\left.I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=1,2, \ldots, m \mid x y \in V \times V\right\} . A B N$ face of $G$ is a region, bounded by the set of $B N$ edges $E^{\prime} \subset E$, of a geometric representation of $G$. The truth, indeterminacy and falsity values of the $B N$ face are:
(i) $\min \left\{\frac{T_{D}^{P}(x y)_{i}}{\min \left\{T_{C}^{P}(x), T_{C}^{P}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$;
(ii) $\max \left\{\frac{T_{N}^{N}(x y)_{i}}{\max \left\{T_{C}^{N}(x), T_{C}^{N}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$;
(iii) $\min \left\{\frac{I_{D}^{P}(x y)_{i}}{\min \left\{I_{C}^{P}(x), I_{C}^{P}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$;
(iv) $\max \left\{\frac{I_{N}^{N}(x y)_{i}}{\max \left\{I_{C}^{N}(x), I_{C}^{N}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$;
(v) $\max \left\{\frac{F_{D}^{P}(x y)_{i}}{\max \left\{F_{C}^{P}(x), F_{C}^{P}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$;
(vi) $\min \left\{\frac{F_{D}^{N}(x y)_{i}}{\min \left\{F_{C}^{N}(x), F_{C}^{N}(y)\right\}}, i=1,2, \ldots, m \mid x y \in E^{\prime}\right\}$.

Definition 2.22 A BN face is called strong $B N$ face if its positive true and indeterminacy value is greater than 0.5 but false value is less than 0.5 , and negative true and indeterminacy value is less than -0.5 but false value is greater than -0.5 . Otherwise, face is weak. Every BN planar graph has an infinite region which is called outer $B N$ face. Other faces are called inner $B N$ faces.

Example 2.23 Consider a BN planar graph as shown in Figure 2.5. The BN planar graph has the following faces:

- BN face $F_{1}$ is bounded by the edges $\left(v_{1} v_{2}, 0.5,0.5,0.1,-0.5,-0.5,-0.1\right),\left(v_{2} v_{3}, 0.6,0.6,0.1\right.$, $-0.6,-0.6,-0.1),\left(v_{1} v_{3}, 0.5,0.5,0.1,-0.5,-0.5,-0.1\right)$;
- outer BN face $F_{2}$ surrounded by edges $\left(v_{1} v_{3}, 0.5,0.5,0.1,-0.5,-0.5,-0.1\right),\left(v_{1} v_{4}, 0.5,0.5\right.$, $0.1,-0.5,-0.5,-0.1),\left(v_{2} v_{4}, 0.6,0.6,0.1,-0.6,-0.6,-0.1\right),\left(v_{2} v_{3}, 0.6,0.6,0.1,-0.6,-0.6,-0.1\right)$;
- BN face $F_{3}$ is bounded by the edges $\left(v_{1} v_{2}, 0.5,0.5,0.1,-0.5,-0.5,-0.1\right),\left(v_{2} v_{4}, 0.6,0.6,0.1\right.$, $-0.6,-0.6,-0.1),\left(v_{1} v_{4}, 0.5,0.5,0.1,-0.5,-0.5,-0.1\right)$.

Clearly, the positive truth, indeterminacy and falsity values of a BN face $F_{1}$ are 0.833 , 0.833 and 0.333 , respectively, and the negative truth, indeterminacy and falsity values of a BN face $F_{1}$ are $-0.833,-0.833$ and -0.333 , respectively. The positive truth, indeterminacy and falsity values of a BN face $F_{3}$ are $0.833,0.833$ and 0.333 , respectively, and the negative truth, indeterminacy and falsity values of a BN face $F_{3}$ are $-0.833,-0.833$ and -0.333 , respectively. Thus $F_{1}$ and $F_{3}$ are strong BN faces.

Figure 2.5 Faces in BN planar graph
We now introduce dual of BN planar graph. In BN dual graph, vertices are corresponding to the strong BN faces of the BN planar graph and each BN edge between two vertices is corresponding to each edge in the boundary between two faces of BN planar graph. The formal definition is given below.

Definition 2.24 Let $G$ be a $B N$ planar graph and let
$D=\left\{\left(x y, T_{D}^{P}(x y)_{i}, I_{D}^{P}(x y)_{i}, F_{D}^{P}(x y)_{i}, T_{D}^{N}(x y)_{i}, I_{D}^{N}(x y)_{i}, F_{D}^{N}(x y)_{i}\right), i=1,2, \ldots, m \mid x y \in V \times V\right\}$.
Let $F_{1}, F_{2}, \ldots, F_{k}$ be the strong $B N$ faces of $G$. The $B N$ dual graph of $G$ is a $B N$ planar graph $G^{\prime}=\left(V^{\prime}, C^{\prime}, D^{\prime}\right)$, where $V^{\prime}=\left\{x_{i}, i=1,2, \ldots, k\right\}$, and the vertex $x_{i}$ of $G^{\prime}$ is considered for
the face $F_{i}$ of $G$. The truth-membership, indeterminacy and false-truth-membership values of vertices are given by the mapping $C^{\prime}=\left(T_{C^{\prime}}^{P}, I_{C^{\prime}}^{P}, F_{C^{\prime}}^{P}, T_{C^{\prime}}^{N}, I_{C^{\prime}}^{N}, F_{C^{\prime}}^{N}\right): V^{\prime} \rightarrow[0,1] \times[0,1] \times[0,1] \times$ $[-1,0] \times[-1,0] \times[-1,0]$ such that
$T_{C^{\prime}}^{P}\left(x_{i}\right)=\max \left\{T_{D^{\prime}}^{P}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong $B N$ face $\left.F_{i}\right\}$,
$T_{C^{\prime}}^{N}\left(x_{i}\right)=\min \left\{T_{D^{\prime}}^{N}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong BN face $\left.F_{i}\right\}$,
$I_{C^{\prime}}^{P}\left(x_{i}\right)=\max \left\{I_{D^{\prime}}^{P}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong $B N$ face $\left.F_{i}\right\}$,
$I_{C^{\prime}}^{N}\left(x_{i}\right)=\min \left\{I_{D^{\prime}}^{N}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong $B N$ face $\left.F_{i}\right\}$,
$F_{C^{\prime}}^{P}\left(x_{i}\right)=\min \left\{F_{D^{\prime}}^{P}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong $B N$ face $\left.F_{i}\right\}$,
$F_{C^{\prime}}^{N}\left(x_{i}\right)=\max \left\{F_{D^{\prime}}^{N}(u v)_{i}, i=1,2, \ldots, p \mid u v\right.$ is an edge of the boundary of the strong $B N$ face $\left.F_{i}\right\}$.
There may exist more than one common edges between two faces $F_{i}$ and $F_{j}$ of $G$. Thus there may be more than one edges between two vertices $x_{i}$ and $x_{j}$ in BN dual graph $G^{\prime}$. Let $\left(T^{P}\right)_{D}^{l}\left(x_{i} x_{j}\right),\left(I^{P}\right)_{D}^{l}\left(x_{i} x_{j}\right)$ and $\left(F^{P}\right)_{D}^{l}\left(x_{i} x_{j}\right)$ denote the positive truth, indeterminacy and falsity membership values of the $l$-th edge between $x_{i}$ and $x_{j}$, and let $\left(T^{N}\right)_{D}^{l}\left(x_{i} x_{j}\right),\left(I^{N}\right)_{D}^{l}\left(x_{i} x_{j}\right)$ and $\left(F^{N}\right)_{D}^{l}\left(x_{i} x_{j}\right)$ denote the negative truth, indeterminacy and falsity membership values of the $l$-th edge between $x_{i}$ and $x_{j}$. The positive and negative truth, indeterminacy and falsity values of the BN edges of the BN dual graph are given by $T_{D^{\prime}}^{P}\left(x_{i} x_{j}\right)_{l}=\left(T^{P}\right)_{D}^{l}(u v)_{j}, I_{D^{\prime}}^{P}\left(x_{i} x_{j}\right)_{l}=\left(I^{P}\right)_{D}^{l}(u v)_{j}$, $F_{D^{\prime}}^{P}\left(x_{i} x_{j}\right)_{l}=\left(F^{P}\right)_{D}^{l}(u v)_{j}, T_{D^{\prime}}^{N}\left(x_{i} x_{j}\right)_{l}=\left(T^{N}\right)_{D}^{l}(u v)_{j}, I_{D^{\prime}}^{N}\left(x_{i} x_{j}\right)_{l}=\left(I^{N}\right)_{D}^{l}(u v)_{j}, F_{D^{\prime}}^{N}\left(x_{i} x_{j}\right)_{l}=$ $\left(F^{N}\right)_{D}^{l}(u v)_{j}$, where $(u v)_{l}$ is an edge in the boundary between two strong BN faces $F_{i}$ and $F_{j}$ and $l=1,2, \ldots, s$, where $s$ is the number of common edges in the boundary between $F_{i}$ and $F_{j}$ or the number of edges between $x_{i}$ and $x_{j}$. If there is any strong pendant edge in the BN planar graph, then there will be a self loop in $G^{\prime}$ corresponding to this pendant edge. The edge truth- membership, indeterminacy-membership and falsity-membership value of the self loop is equal to the truth- membership, indeterminacy-membership and falsity-membership value of the pendant edge. Single-valued neutrosophic dual graph of BN planar graph does not contain point of intersection of edges for a certain representation, so it is BN planar graph with planarity value $(1,1,1,-1,-1,-1)$. Thus the BN face of BN dual graph can be similarly described as in BN planar graphs.

Example 2.25 Consider a BN planar graph $G=(V, A, B)$ as shown in Figure 2.6 such that $V=\{a, b, c, d\}, C=(a, 0.6,0.6,0.2,-0.6,-0.6,-0.2),(b, 0.7,0.7,0.2,-0.7,-0.7,-0.2)$, $(c, 0.8,0.8,0.2,-0.8,-0.8,-0.2),(d, 0.9,0.9,0.1,-0.9,-0.9,-0.1)$, and $D=\{(a b, 0.5,0.5,0.01$, $-0.5,-0.5,-0.01),(a c, 0.4,0.4,0.01,-0.4,-0.4,-0.01),(a d, 0.55,0.55,0.01,-0.55,-0.55,-0.01)$, $(b c, 0.45,0.45,0.01,-0.45,-0.45,-0.01),(b c, 0.6,0.6,0.01,-0.6,-0.6,-0.01),(c d, 0.7,0.7,0.01$, $-0.7,-0.7,-0.01)\}$.

The BN planar graph has the following faces:

- BN face $F_{1}$ is bounded by $(a b, 0.5,0.5,0.01,-0.5,-0.5,-0.01),(a c, 0.4,0.4,0.01,-0.4,-0.4$, $-0.01),(b c, 0.45,0.45,0.01,-0.45,-0.45,-0.01)$;
- BN face $F_{2}$ is bounded by $(a d, 0.55,0.55,0.01,-0.55,-0.55,-0.01),(c d, 0.7,0.7,0.01,-0.7$, $-0.7,-0.01),(a c, 0.4,0.4,0.01,-0.4,-0.4,-0.01)$;
- BN face $F_{3}$ is bounded by $(b c, 0.45,0.45,0.01,-0.45,-0.45,-0.01),(b c, 0.6,0.6,0.01,-0.6$, $-0.6,-0.01$ );
- outer BN face $F_{4}$ is surrounded by $(a b, 0.5,0.5,0.01,-0.5,-0.5,-0.01),(b c, 0.6,0.6,0.01$, $-0.6,-0.6,-0.01),(c d, 0.7,0.7,0.01,-0.7,-0.7,-0.01),(a d, 0.55,0.55,0.01,-0.55,-0.55,-0.01)$.

Figure 2.6 Neutrosophic dual graph
Routine calculations show that all faces are strong BN faces. For each strong BN face, we consider a vertex for the BN dual graph. So the vertex set $V^{\prime}=\left\{x_{1}, x_{2}, x_{3}, x_{4}\right\}$, where the vertex $x_{i}$ is taken corresponding to the strong BN face $F_{i}, i=1,2,3,4$. Thus

$$
\begin{gathered}
T_{C^{\prime}}^{P}\left(x_{1}\right)=\max \{0.5,0.4,0.45\}=0.5, \quad T_{C^{\prime}}^{P}\left(x_{2}\right)=\max \{0.55,0.7,0.4\}=0.7, \\
T_{C^{\prime}}^{N}\left(x_{1}\right)=\min \{-0.5,-0.4,-0.45\}=-0.5, \quad T_{C^{\prime}}^{N}\left(x_{2}\right)=\min \{-0.55,-0.7,-0.4\}=-0.7, \\
I_{C^{\prime}}^{P}\left(x_{1}\right)=\max \{0.5,0.4,0.45\}=0.5, \quad I_{C^{\prime}}^{P}\left(x_{2}\right)=\max \{0.55,0.7,0.4\}=0.7, \\
I_{C^{\prime}}^{N}\left(x_{1}\right)=\min \{-0.5,-0.4,-0.45\}=-0.5, \quad I_{C^{\prime}}^{N}\left(x_{2}\right)=\min \{-0.55,-0.7,-0.4\}=-0.7, \\
F_{C^{\prime}}^{P}\left(x_{1}\right)=\min \{0.01,0.01,0.01\}=0.01, \quad F_{C^{\prime}}^{P}\left(x_{2}\right)=\min \{0.01,0.01,0.01\}=0.01, \\
F_{C^{\prime}}^{N}\left(x_{1}\right)=\max \{-0.01,-0.01,-0.01\}=-0.01, \quad F_{C^{\prime}}^{N}\left(x_{2}\right)=\max \{-0.01,-0.01,-0.01\}=-0.01, \\
T_{C^{\prime}}^{P}\left(x_{3}\right)=\max \{0.45,0.6\}=0.6, \quad T_{C^{\prime}}^{P}\left(x_{4}\right)=\max \{0.5,0.6,0.7,0.55\}=0.7, \\
T_{C^{\prime}}^{N}\left(x_{3}\right)=\min \{-0.45,-0.6\}=-0.6, \quad T_{C^{\prime}}^{N}\left(x_{4}\right)=\min \{-0.5,-0.6,-0.7,-0.55\}=-0.7, \\
I_{C^{\prime}}^{P}\left(x_{3}\right)=\max \{0.45,0.6\}=0.6, \quad I_{C^{\prime}}^{P}\left(x_{4}\right)=\max \{0.5,0.6,0.7,0.55\}=0.7, \\
F_{C^{\prime}}^{P}\left(x_{3}\right)=\min \{0.01,0.01\}=0.01, \quad F_{C^{\prime}}^{P}\left(x_{4}\right)=\min \{0.01,0.01,0.01,0.01\}=0.01, \\
F_{C^{\prime}}^{N}\left(x_{3}\right)=\max \{-0.01,-0.01\}=-0.01, \quad F_{C^{\prime}}^{N}\left(x_{4}\right)=\max \{-0.01,-0.01,-0.01,-0.01\}=-0.01 .
\end{gathered}
$$

There are two common edges $a d$ and $c d$ between the faces $F_{2}$ and $F_{4}$ in $G$. Hence between the vertices $x_{2}$ and $x_{4}$, there exist two edges in the BN dual graph of $G$. Truth-membership, indeterminacy-membership and falsity-membership values of these edges are given by

$$
T_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=T_{D}^{P}(c d)=0.7, T_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=T_{D}^{P}(a d)=0.55, I_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=I_{D}^{P}(c d)=0.7
$$

$$
\begin{gathered}
I_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=I_{D}^{P}(a d)=0.55, F_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=F_{D}^{P}(c d)=0.01, F_{D^{\prime}}^{P}\left(x_{2} x_{4}\right)=F_{D}^{P}(a d)=0.01 \\
T_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=T_{D}^{N}(c d)=-0.7, T_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=T_{D}^{N}(a d)=-0.55, I_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=I_{D}^{N}(c d)=-0.7 \\
I_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=I_{D}^{N}(a d)=-0.55, F_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=F_{D}^{N}(c d)=-0.01, F_{D^{\prime}}^{N}\left(x_{2} x_{4}\right)=F_{D}^{N}(a d)=-0.01
\end{gathered}
$$

The truth- membership, indeterminacy-membership and falsity-membership values of other edges of the BN dual graph are calculated as

$$
\begin{gathered}
T_{D^{\prime}}^{P}\left(x_{1} x_{3}\right)=T_{D}^{P}(b c)=0.45, T_{D^{\prime}}^{P}\left(x_{1} x_{2}\right)=T_{D}^{P}(a c)=0.4, T_{D^{\prime}}^{P}\left(x_{1} x_{4}\right)=T_{D}^{P}(a b)=0.5 \\
T_{D^{\prime}}^{P}\left(x_{3} x_{4}\right)=T_{D^{\prime}}^{P}(b c)=0.6, T_{D^{\prime}}^{N}\left(x_{1} x_{3}\right)=T_{D}^{N}(b c)=-0.45, T_{D^{\prime}}^{N}\left(x_{1} x_{2}\right)=T_{D}^{N}(a c)=-0.4, \\
T_{D^{\prime}}^{N}\left(x_{1} x_{4}\right)=T_{D}^{N}(a b)=-0.5, T_{D^{\prime}}^{N}\left(x_{3} x_{4}\right)=T_{D^{\prime}}^{N}(b c)=-0.6, I_{D^{\prime}}^{P}\left(x_{1} x_{3}\right)=I_{D}^{P}(b c)=0.45 \\
I_{D^{\prime}}^{P}\left(x_{1} x_{2}\right)=I_{D}^{P}(a c)=0.4, I_{D^{\prime}}^{P}\left(x_{1} x_{4}\right)=I_{D}^{P}(a b)=0.5, I_{D^{\prime}}^{P}\left(x_{3} x_{4}\right)=I_{D^{\prime}}^{P}(b c)=0.6 \\
I_{D^{\prime}}^{N}\left(x_{1} x_{3}\right)=I_{D}^{N}(b c)=-0.45, I_{D^{\prime}}^{N}\left(x_{1} x_{2}\right)=I_{D}^{N}(a c)=-0.4, I_{D^{\prime}}^{N}\left(x_{1} x_{4}\right)=I_{D}^{N}(a b)=-0.5 \\
I_{D^{\prime}}^{N}\left(x_{3} x_{4}\right)=I_{D^{\prime}}^{N}(b c)=-0.6, F_{D^{\prime}}^{P}\left(x_{1} x_{3}\right)=T_{D}^{P}(b c)=0.01, F_{D^{\prime}}^{P}\left(x_{1} x_{2}\right)=F_{D}^{P}(a c)=0.01 \\
F_{D^{\prime}}^{P}\left(x_{1} x_{4}\right)=F_{D}^{P}(a b)=0.01, F_{D^{\prime}}^{P}\left(x_{3} x_{4}\right)=F_{D}^{P}(b c)=0.01 F_{D^{\prime}}^{N}\left(x_{1} x_{3}\right)=T_{D}^{N}(b c)=0.01 \\
F_{D^{\prime}}^{N}\left(x_{1} x_{2}\right)=F_{D}^{N}(a c)=0.01, F_{D^{\prime}}^{N}\left(x_{1} x_{4}\right)=F_{D}^{N}(a b)=0.01, F_{D^{\prime}}^{N}\left(x_{3} x_{4}\right)=F_{D}^{N}(b c)=0.01
\end{gathered}
$$

Thus the edge set of BN dual graph is $D^{\prime}=\left\{\left(x_{1} x_{3}, 0.45,0.45,0.01,-0.45,-0.45,-0.01\right),\left(x_{1} x_{2}\right.\right.$, $0.4,0.4,0.01,-0.4,-0.4,-0.01),\left(x_{1} x_{4}, 0.5,0.5,0.01,-0.5,-0.5,-0.01\right),\left(x_{3} x_{4}, 0.6,0.6,0.01,-0.6\right.$, $\left.-0.6,-0.01),\left(x_{2} x_{4}, 0.7,0.7,0.01,-0.7,-0.7,-0.01\right),\left(x_{2} x_{4}, 0.55,0.55,0.01,-0.55,-0.55,-0.01\right)\right\}$. In Figure 2.6, the BN dual graph $G^{\prime}=\left(V^{\prime}, C^{\prime}, D^{\prime}\right)$ of $G$ is drawn by dotted line.

Weak edges in planar graphs are not considered for any calculation in BN dual graphs. We state the following Theorem without its proof.

Theorem 2.26 Let $G=(V, C, D)$ be a $B N$ planar graph without weak edges and the $B N$ dual graph of $G$ be $G^{\prime}=\left(V^{\prime}, C^{\prime}, D^{\prime}\right)$. The truth- membership indeterminacy-membership and falsitymembership values of $B N$ edges of $G^{\prime}$ are equal to truth- membership, indeterminacy-membership and falsity-membership values of the $B N$ edges of $G$.

## 3. Applications

Graph is considered an important part of Mathematics for solving countless real World problems in information technology, psychology, engineering, combinatorics and medical sciences. Everything in this World is connected, for instance, cities and countries are connected by roads, railways are linked by railway lines, flight networks are connected by air, electrical devices are connected by wires, pages on internet by hyperlinks, components of electric circuits by various paths, and many more. Scientists, analysts and engineers are trying to optimize these networks to find a way to save millions of lives by reducing traffic accidents, plane crashes and circuit shots. Planar graphs are used to find such graphical representations of networks without any crossing or minimum number of crossings. But there is always an uncertainty and degree of
indeterminacy in data which can be dealt using bipolar neutrosophic graphs. We now present applications of bipolar neutrosophic graphs in road networks.

1. Road network model to monitor traffic: Roads are a mean of frequent and unacceptable number of fatalities every year. Road accidents are increasing due to dense traffic, negligence of drivers and speed of vehicles. Traffic accidents can be minimized by modeling road networks to monitor the traffic, apply quick emergency services and to take action against the speedily going vehicles quickly. The practical approach of bipolar neutrosophic planar graphs can be applied to construct road networks, as these are the combination of vertices and edges along with the degree of truth, indeterminacy and falsity. The method for the construction of road network is given in Algorithm 1.

## Algorithm 1

1. Input the $n$ number of location $L_{1}, L_{2}, \ldots, L_{n}$.
2. Input the bipolar neutrosophic set of cities.
3. Input the adjacency matrix of $\xi=\left[\xi_{i j}\right]_{n \times n}$ of cities.
4. do $i$ from $1 \rightarrow n$
5. do $j$ from $1 \rightarrow n$
6. if $\left(i<j, \xi_{i j} \neq(0,0,1,0,0,-1)\right)$ then
7. Draw an edge between $L_{i}$ and $L_{j}$.
8. $\quad B\left(L_{i} L_{j}\right)=\xi_{i j}$
9. end if
10. end do

## 11. end do

Consider the problem of road networks between 6 locations $L_{1}, L_{2}, L_{3}, L_{4}, L_{5}, L_{6}$. The degree of memberships of cities and roads between cities is given in Tables 3.1 and 3.2.

The positive degree of membership $T^{p}(x)$ of each vertex $x$ represents the percentage that vehicles traveling to or from this city are dense, $I^{p}(x)$ and $F^{p}(x)$ represent the indeterminacy and falsity in this percentage. The negative degree of membership $T^{n}(x)$ represents the percentage that traffic is not dense, $I^{n}(x)$ and $F^{n}(x)$ represent the indeterminacy and falsity in this percentage. The positive degree of memberships of each edge $x y$ indicate the percentage of truth, indeterminacy and falsity of road accidents through this road. The negative degree of memberships of $x y$ show the percentage of truth, indeterminacy and falsity that the road is safer. The bipolar neutrosophic model of road connections between the cities is shown in Figure 3.1. This bipolar neutrosophic model can be used to check and monitor the percentage of annual
accidents. Also, by monitoring and taking special security actions, the total number of accidents can be minimized.

| $A$ | $L_{1}$ | $L_{2}$ | $L_{3}$ | $L_{4}$ | $L_{5}$ | $L_{6}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $T_{A}^{p}$ | 0.7 | 0.5 | 0.8 | 0.6 | 0.5 | 0.4 |
| $I_{A}^{p}$ | 0.4 | 0.4 | 0.2 | 0.1 | 0.4 | 0.5 |
| $F_{A}^{p}$ | 0.2 | 0.3 | 0.2 | 0.1 | 0.4 | 0.5 |

Table 3.2 Bipolar neutrosophic set of roads

Figure 3.1 Bipolar neutrosophic road model
2. Electrical connections: Graph theory is extensively used in designing circuit connections and installation of wires in order to prevent crossing which can cause dangerous electrical hazards. The twisted and crossing wires are a serious safety risk to human life. There is a need to install electrical wires to reduce crossing. Bipolar neutrosophic planar graphs can be used to model electrical connections and to study the degree of damage that can cause due to the connection.

Consider the problem of setting electrical wires between 5 electrical utilities and power plugs $E_{1}, E_{2}, E_{3}, E_{4}, E_{5}$ in a factory as shown in Figure 3.2.

Figure 3.2 Electrical connections

Figure 3.3 Bipolar neutrosophic planar graph

The positive degree of membership $T^{p}\left(E_{i}\right)$ of each vertex $E_{i}$ represents the percentage of faults and electrical sparks of utility or power plug $E_{i}, I^{p}\left(E_{i}\right)$ and $F^{p}\left(E_{i}\right)$ represent the indeterminacy and falsity in this percentage. The negative degree of membership $T^{n}\left(E_{i}\right)$ represents the percentage that $E_{i}$ is update and safer, $I^{n}(x)$ and $F^{n}(x)$ represent the indeterminacy and falsity in this percentage. The positive degree of memberships of each edge $E_{i} E_{j}$ indicate the percentage of truth, indeterminacy and falsity of electrical hazards through this connection. The negative degree of memberships of $E_{i} E_{j}$ show the percentage of truth, indeterminacy and falsity that the connection is safer. The crossing of wires can be reduced if we change the geometrical representation of Figure 3.2. The other representation is shown in Figure 3.3 which has only one crossing, at point $P_{1}$, between the edges $E_{1} E_{4}$ and $E_{2} E_{5}$. The electrical damage at crossing point $P_{1}$ can be reduced by using better electrical wires between $E_{1}$ and $E_{4}, E_{2}$ and $E_{5}$.

The method for the construction of bipolar neutrosophic planar graph is given in Algorithm 2.

## Algorithm 2

1. Input the $n$ number of utilities $E_{1}, E_{2}, \ldots, E_{n}$ and $p$ number of connections $e_{1}, e_{2}, \ldots, e_{p}$.
2. Input the bipolar neutrosophic set of utilities.
3. Input the points of intersection $P_{1}, P_{2}, \ldots, P_{r}$.
4. do $i$ from $1 \rightarrow r$
5. $\quad P_{i}$ is a point of intersection between $e_{j}$ and $e_{k}$.
6. Change the graphical representation of one of the edges $e_{j}$ and $e_{k}$.
7. if There is no new point of intersection in this representation then
8. Keep this graphical representation.
9. else
10. Keep the previous graphical representation.
11. end if
12. end do
